Effective Decision-Making in the Changing World of Public Safety

Why is Evidence-Based Research Important?

What is Evidence-Based Decision Making (EBDM)?

Evidence-based decision making is a strategy for making the best decision possible based on facts and evidence compiled using a set of planning and analysis tools.

Why is Evidence-Based Research Important?

- External decision-makers who approve departmental budgets may not view departmental requests as justified if they lack clear and compelling evidence

Why is Evidence-Based Research Important?

- Policies and strategies that are evidence-based often produce better results, which can increase credibility and support for the department as a whole

Navigating the World of Evidence

- Problem construction and definition
- Evaluating evidence and thinking critically
- Contextualizing evidence
 - Explanatory value
 - Environmental scan
 - SWOT (Strengths, Weaknesses, Opportunities, and Threats)
- Articulating evidence and making decisions

The Roots of Evidence-Based Approaches

- Increasing governmental fiscal pressures during the 1980's
- Increasing efforts to link research and clinical practice to support positive medical outcomes

Leaders and EBDM: Challenges

- Administrators often feel pressured to make decisions quickly and with incomplete and/or outdated information
- Most people rely on personal experience, observation, or “gut instinct” when having to make a choice
- Poorly made decisions increase conflict and diminish morale

Understanding the Term *Evidence*

- **Quantitative research** involves generating numbers and statistics, and leveraging analytics
- **Qualitative research** involves generating subjective information that is helpful in determining preferences, values, or perspectives of those responding to the questions

Defining the Problem

Problem

A question to be considered, solved, or answered, often involving an obstacle, challenge, impediment, or difficulty in understanding or a situation that invites resolution to find a solution to a problem.

Developing a Plan: Statement of Organizational Values

- Organizational purpose
- Short, mid, long-term organizational vision
- Representation of core beliefs

Developing a Plan: Statement of Goals and Objectives

- Organizational goals are the broader targets for which one is aiming
- Objectives are the midterm steps one sets to achieve those goals

Thinking Critically: Linking Evidence to Explanations

- We must find an explanation that is consistent with at least most of the evidence we have to date
- We must then conduct secondary tests to see whether those explanations hold up
- Working and null hypotheses

Collecting Evidence: Environmental Scans

Types of Environmental Scans:

- Using Internet Search Engines
- Effective Searches on Google
- Framing Your Environmental Scan
- Example: Reviewing changes in the United Kingdom Police / Fire Services

Statistics

- A Tool for Decision-Making
- A Discussion of Measurement
- Descriptive Statistics
- Inferential Statistics
- Statistical Modelling

Descriptive Statistics

- Descriptive statistics summarize the characteristics of a group
- Measuring *typicality*
- Measuring *variability*

Statistics: Inferential Statistics

- Population Estimates
 - Random selection
 - Equal chance
 - Independence
- Significant Differences

Evidence based decision making with Key performance Management - Evidence to Practice

- ❑ Strategies deployed by Surrey Fire Service
- ❑ Building the environment for continued success
- ❑ Measuring what matters

Examples of Organizational Goals and Objectives within the Fire Services

Broad goals may be such things as setting targets for reducing the number of residential fires, fatalities and injuries in the community, or increasing the unit's capacity to handle a broader range of service demands

Examples of Organizational Goals and Objectives within the Fire Services

To achieve the goal of reducing the number of residential fires, fatalities and injuries, it is often necessary to make a list of objectives that form a series of intermediate steps

For example, one objective might be to conduct research into best practices to determine if others have had success

Smoke Alarms Don't Work Forever

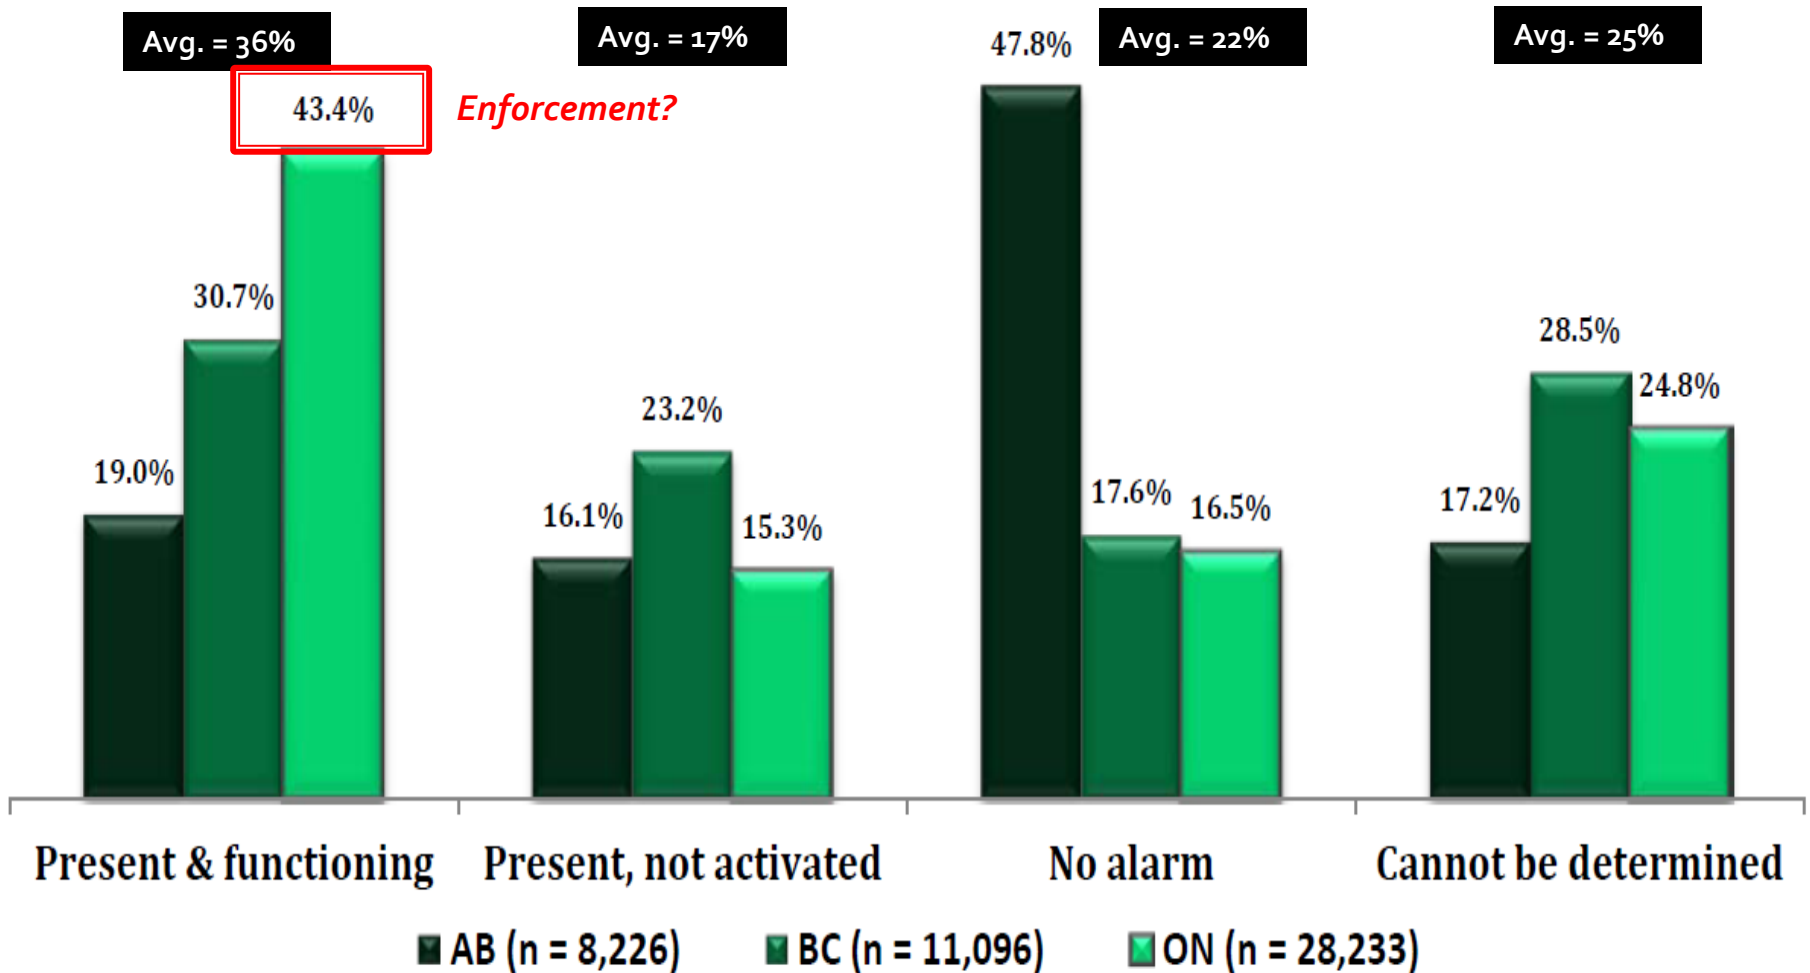

1988 – 2007: the Problem

The Local Origin of the Program: Understanding a Local Problem

- **20-year review of fires in Surrey, BC** (completed 2008)
 - 75% of fires were residential properties
 - 30% of fires had a functioning smoke alarm
- **International best practices demonstrate (UK)**
 - Functioning smoke alarms save lives
 - Fire risk is non-random: high-risk people, properties, places
 - Fire-prevention home visits and education make a difference

The National Score Card is Very Poor...

Death Rates Based on Status of Smoke Alarm 2007-2017

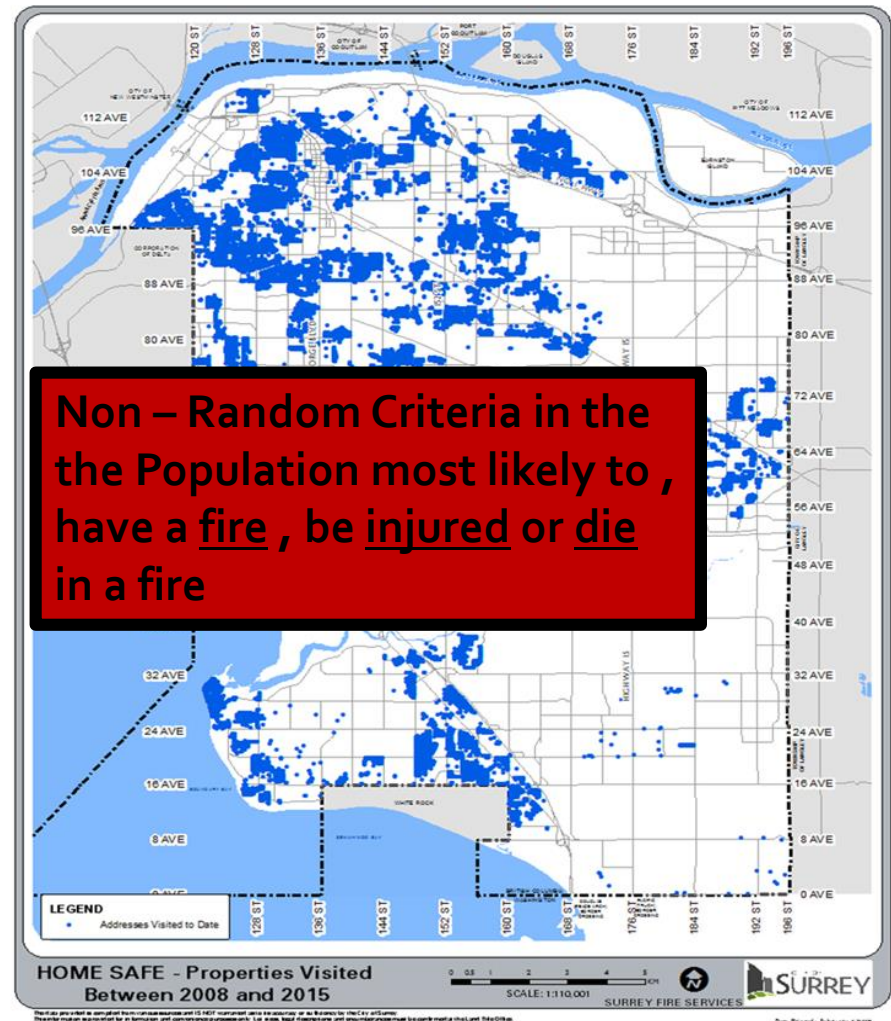

**BC Residential Structure Fires - Death Rate per 1,000 Fires
Comparing Working Smoke Alarms and Non-Working Smoke Alarms**

Working Smoke Alarms: Death Rate per 1,000 Fires No Working Smoke Alarms: Death Rate per 1,000 Fires

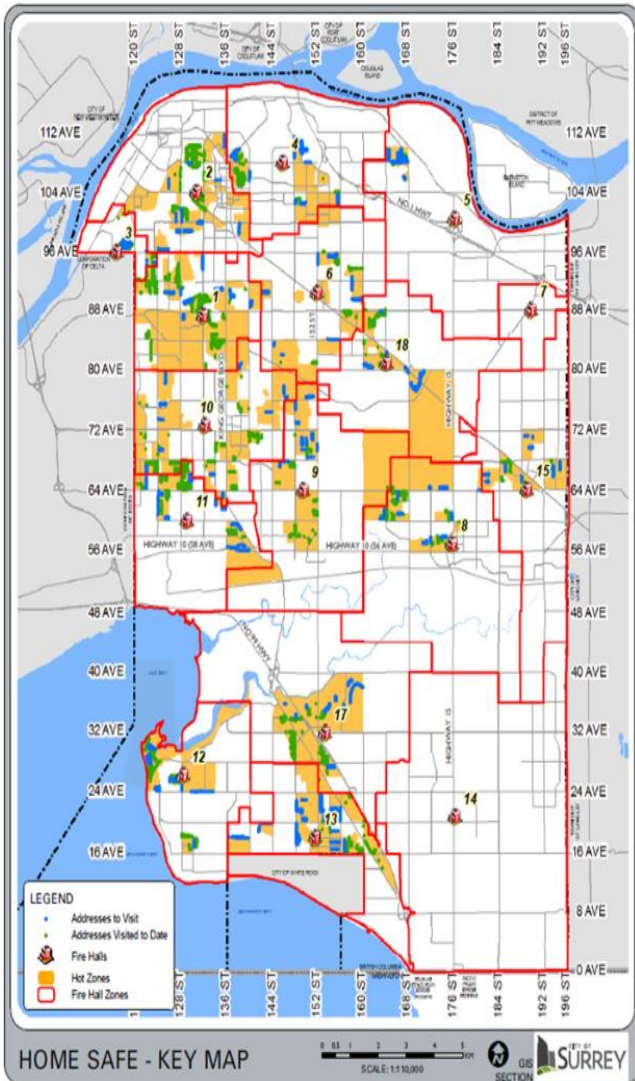

Leverage of Surrey on Duty Resources for Prevention Outreach Initiatives: Residential

- Research told us how to identify high-risk dwellings in the city.
- Data driven decisions were made to identify high-risk areas – top 10% for the following:
 - High proportion of elderly citizens (over 64 yrs), and young children (under 6 yrs)
 - Disadvantaged: Unemployed; Single-parent families
 - High residential mobility
 - Combined with *hot-spots* for recent fire incidents

Finding the Vulnerable Areas

Fitting this into the Bigger Picture?

Fitting this into the Bigger Picture?

Surrey – Residential Structure Fires % of Working Smoke Alarm

City of Surrey Residential Structure Fires: Working Smoke Alarm (%)

Data was accessed January 11, 2018 from the OFC.

BC – Residential Structure Fires % of Working Smoke Alarm

BC Residential Structure Fires: Working Smoke Alarm (%)

— Smoke Alarms Working

BC Declining Deaths from Fire

BC Declining Deaths from Fire

Fire Death Rate per 100,000 residents in British Columbia: 2005-2017

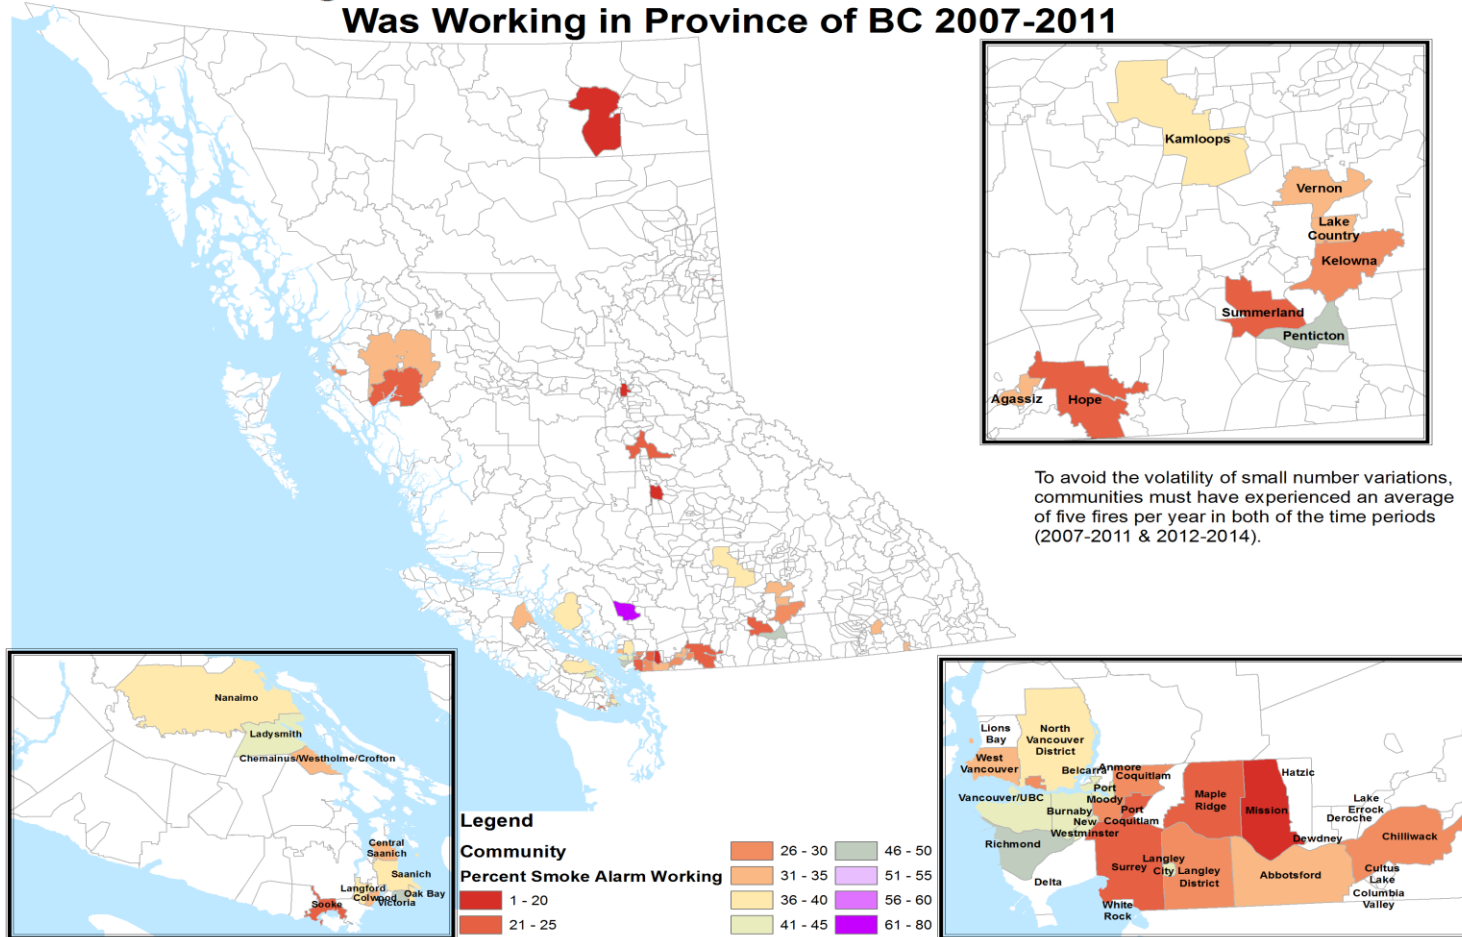

Proxy For a Safe Community Might be a working smoke alarm

Regional performance pre-movement

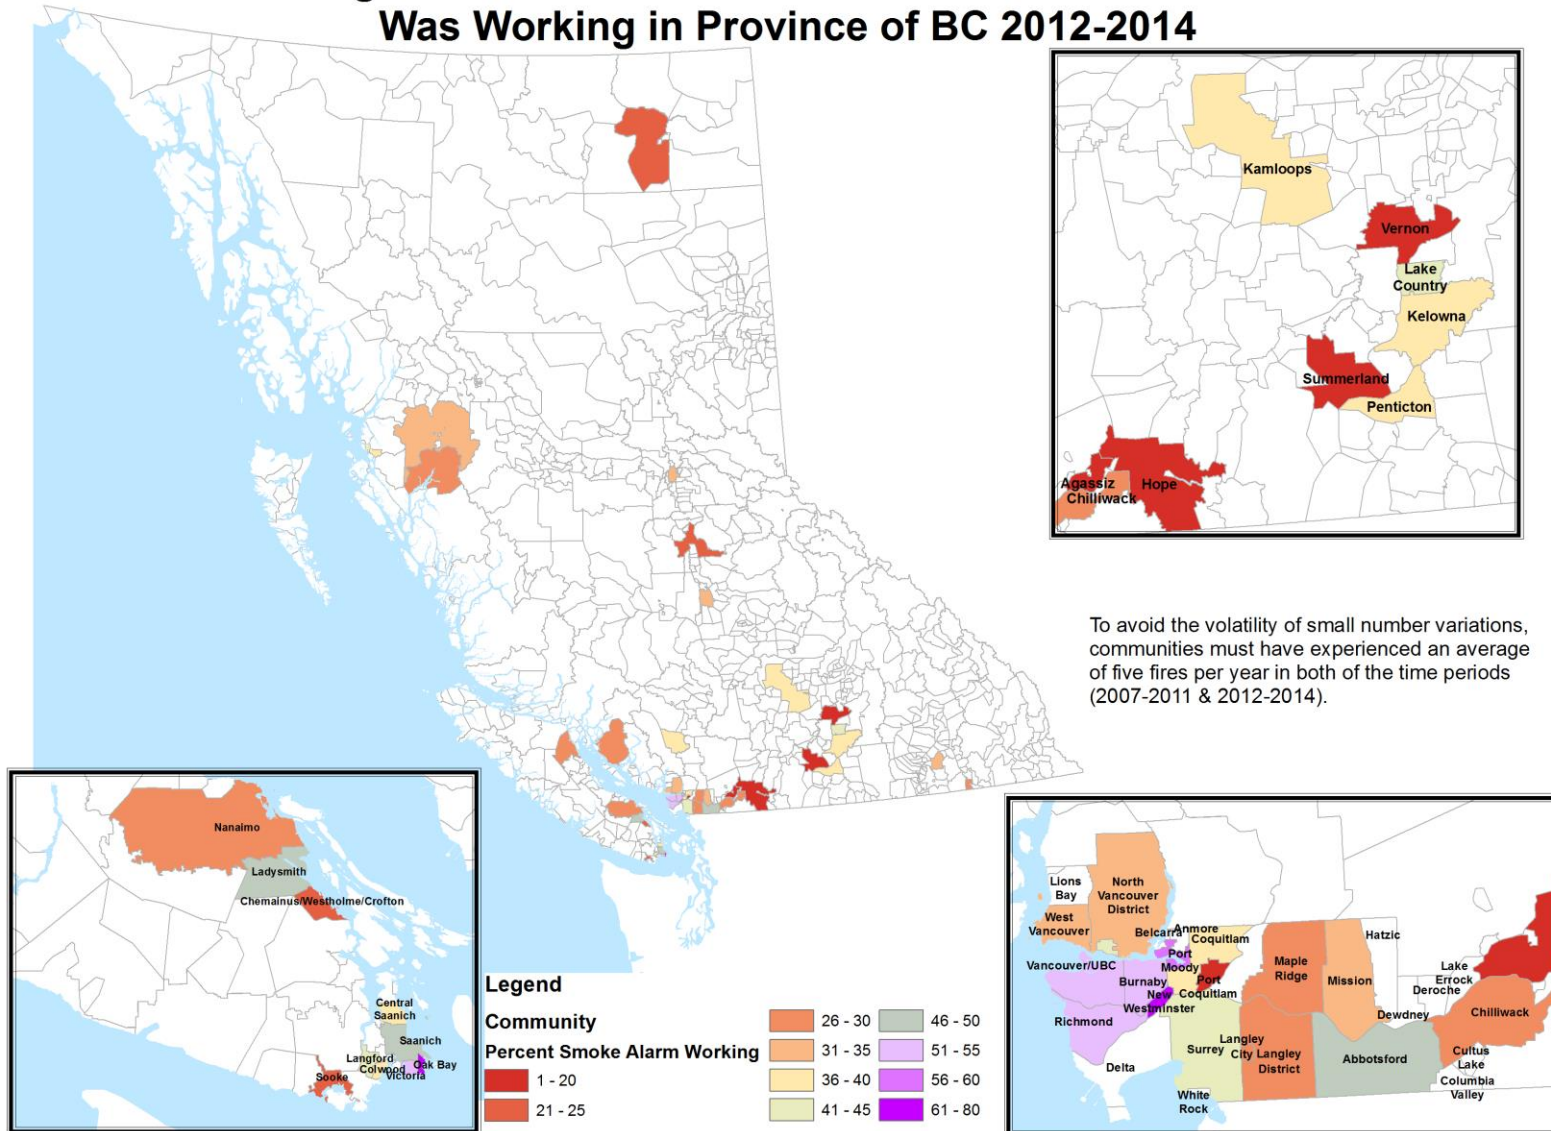

Percentage of Residential Structure Fires where Smoke Alarm Was Working in Province of BC 2007-2011

To avoid the volatility of small number variations, communities must have experienced an average of five fires per year in both of the time periods (2007-2011 & 2012-2014).

Regional performance post-movement

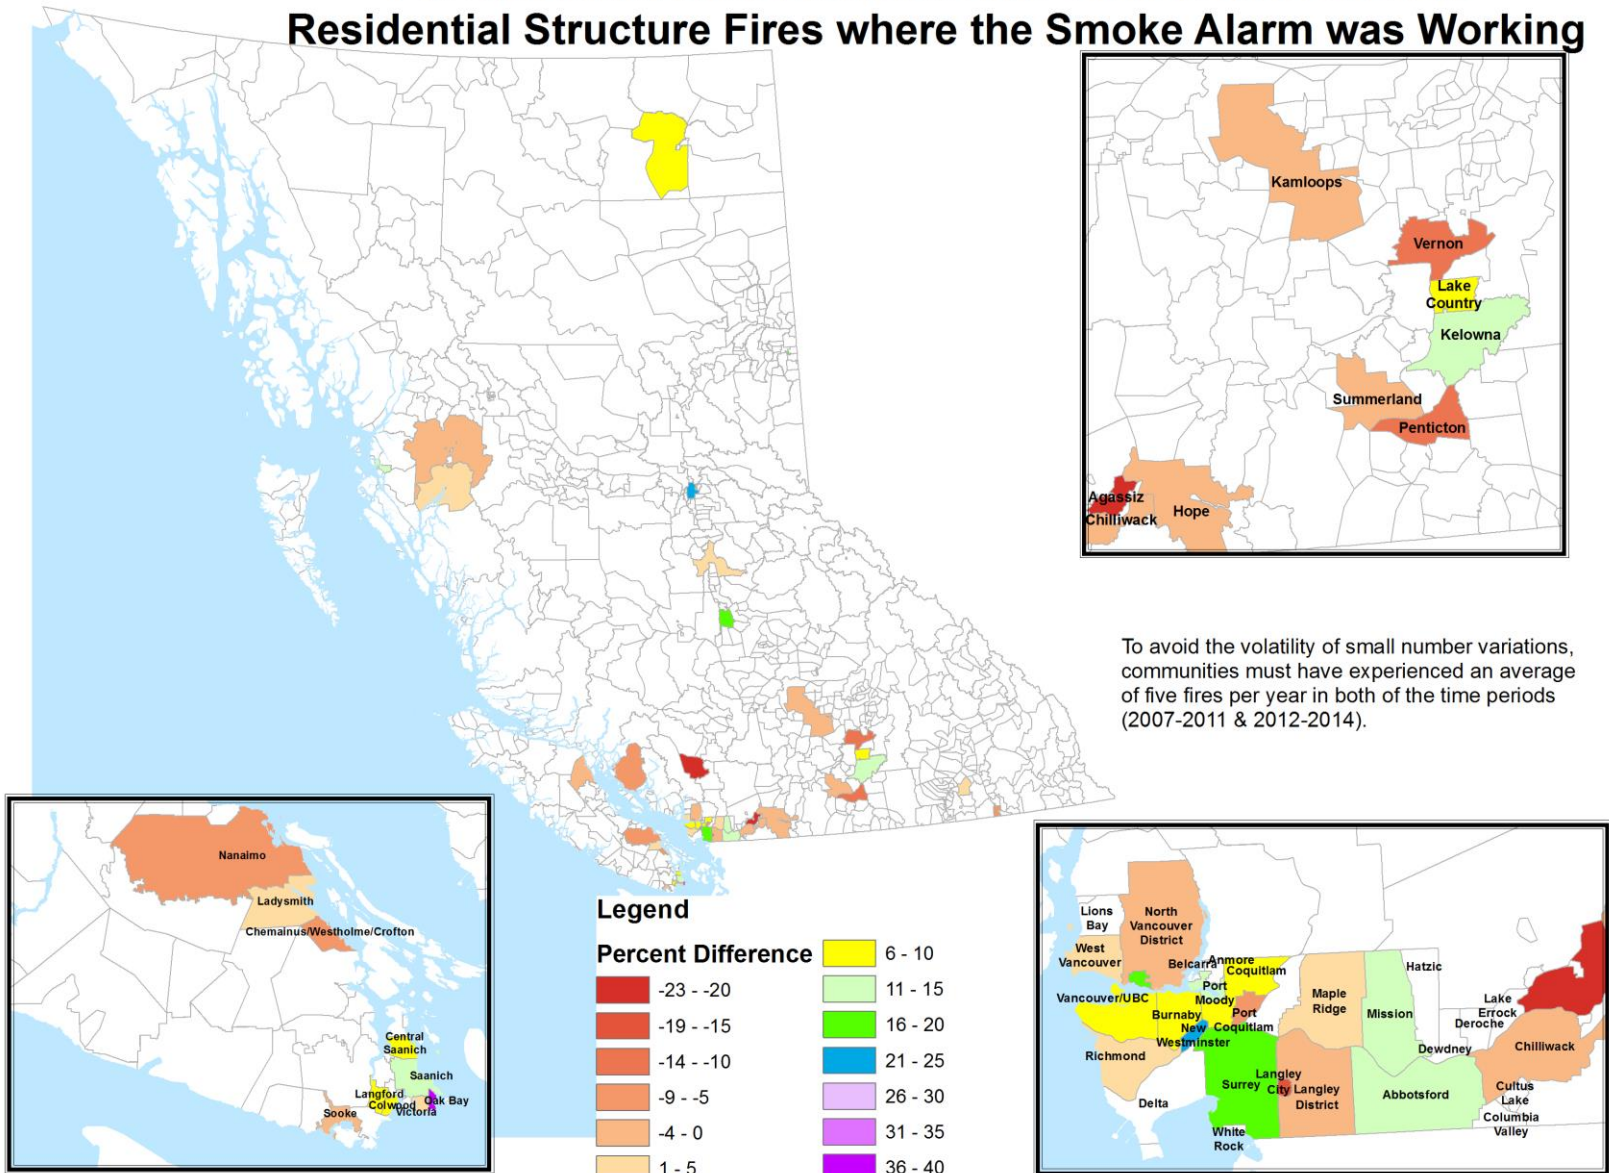

Percentage of Residential Structure Fires where Smoke Alarm Was Working in Province of BC 2012-2014

To avoid the volatility of small number variations, communities must have experienced an average of five fires per year in both of the time periods (2007-2011 & 2012-2014).

Regional variation over time

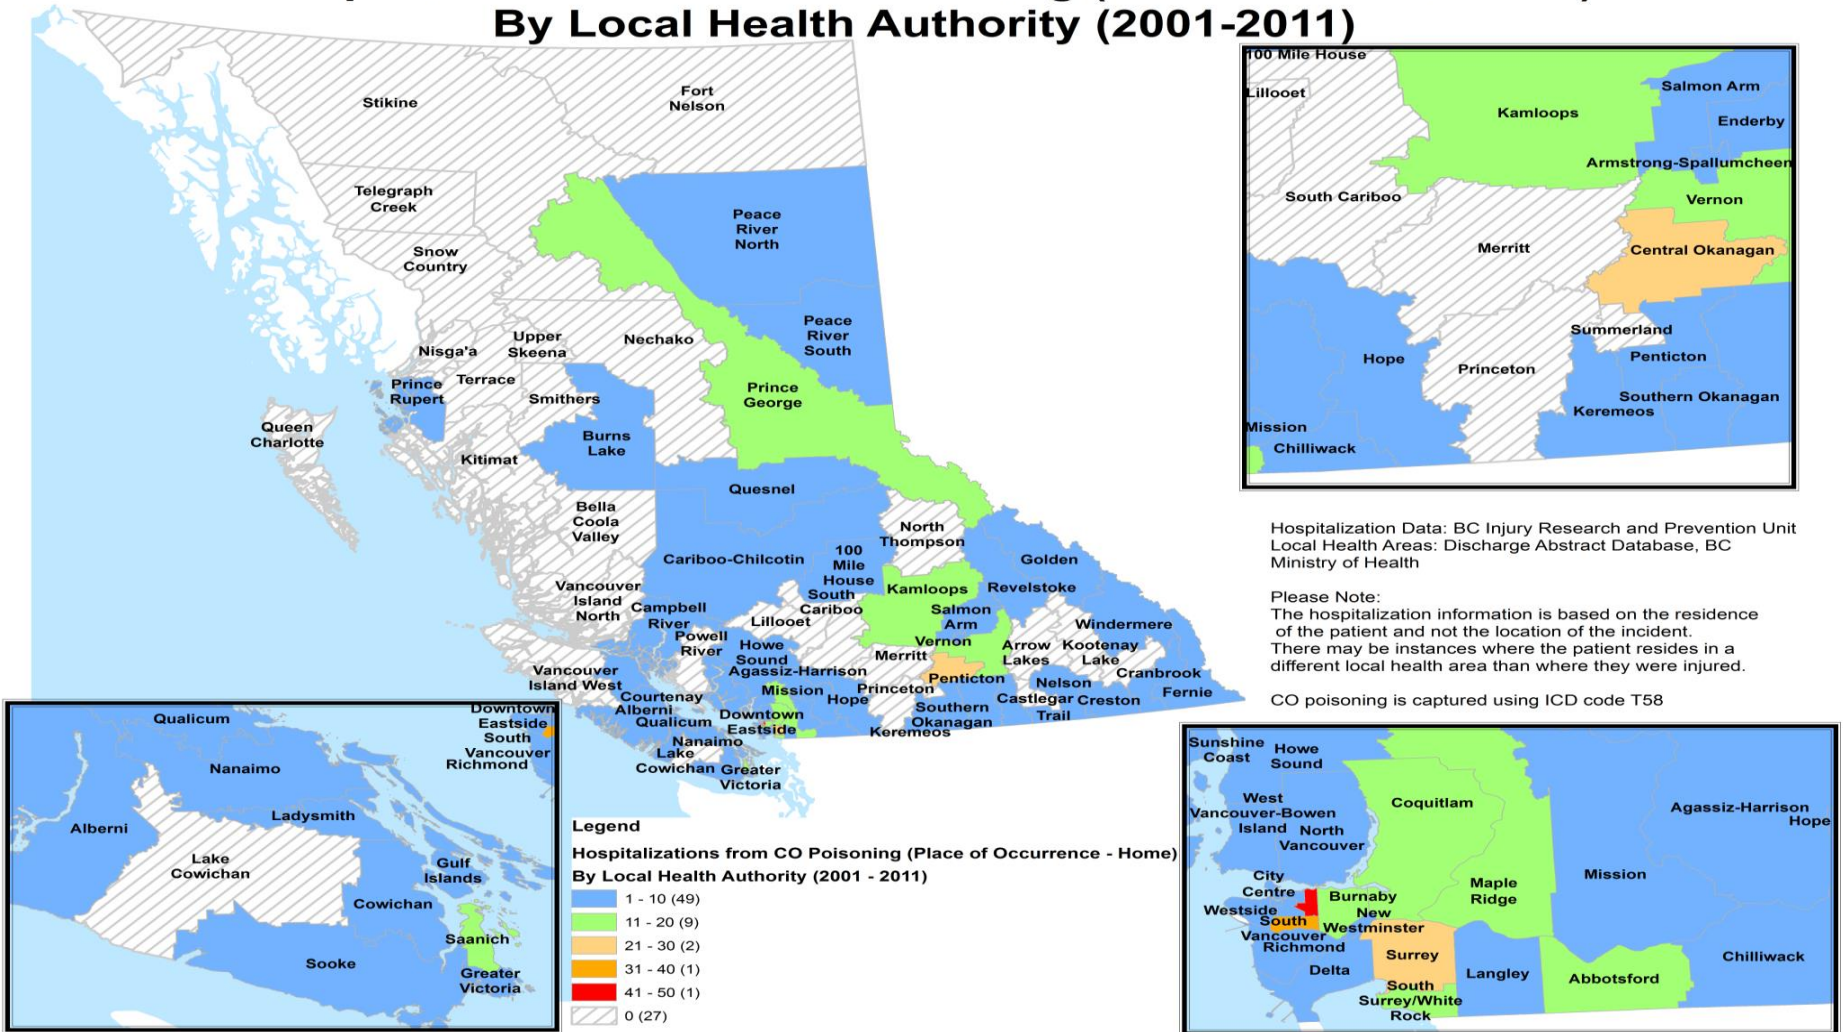

Percent Difference Between 2007-2011 & 2012-2014 in Residential Structure Fires where the Smoke Alarm was Working

To avoid the volatility of small number variations, communities must have experienced an average of five fires per year in both of the time periods (2007-2011 & 2012-2014).

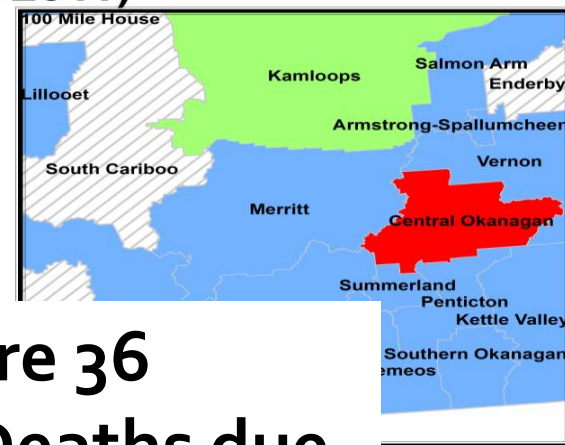

There's a new opportunity to add value in Co Detection

Hospitalizations from CO Poisoning (Occurrence at Home) By Local Health Authority (2001-2011)

There's a new opportunity to add value in Co Detection

**Mortality from CO Poisoning (Occurrence at Home)
By Local Health Authority (2001-2011)**

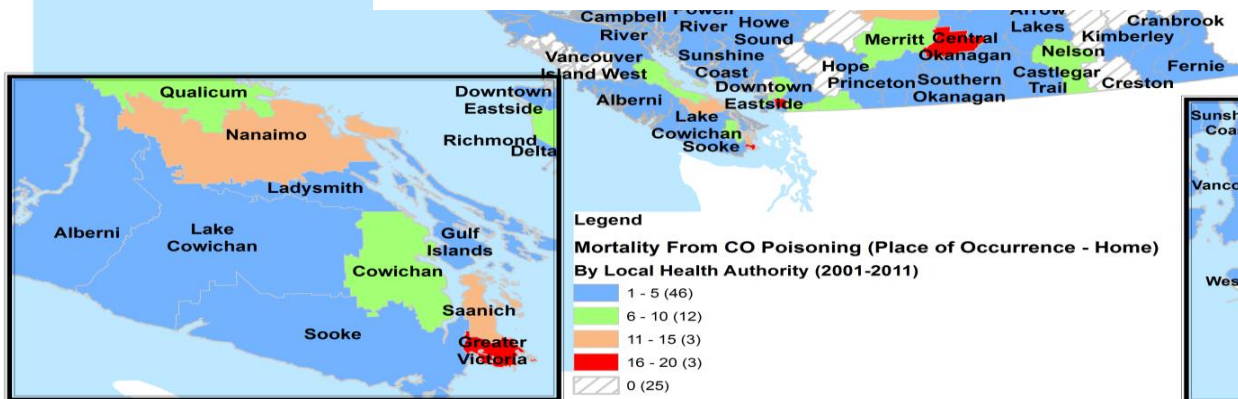

On Average there are 36 Hospitalizations and 11 Deaths due to CO Poisoning in BC per year

nd Prevention Unit
s Agency

1 the
the location of the incident.

CO poisoning is captured using ICD code T58

There's still room for improvement

- **Plenty of room for improvement in smoke alarm coverage**
- **Fundamental to ensuring ongoing reductions in fire-related fatalities**
 - Data-driven, targeted interventions
- **Target risk**
 - Individuals, communities
 - Risky areas in houses
 - Risky areas in Cities

Measuring Outcomes ?

Predictive Analysis

- Analytical tools are widely used in the fire services to assist with deployment decisions
- Techniques range from probabilistic models to systems analysis and simulations
- The *Deccan* suite of products is a predictive toolkit used to move units up to fill existing and/or expected gaps in coverage

Statistical Modelling

- What is the relative impact of various components of the model on the outcome?
- Are those impacts large enough to be meaningful from a policy perspective?
- How do the various components in the model interact with one another?

Costing Analysis: Steps to Consider

- Conducting a financial (cost-benefit or cost-effectiveness) analysis of the options under consideration
- Preparing an accounting statement summarizing the results

Cost-Benefit Analysis

- Define the problem
- Identify any constraints or limiting factors
- List the alternatives
- List the benefits
- How are the costs and benefits to be quantified?

Finally Making The Right Decision

- Using Evidence
- Identify and Frame the Question
- Gather the Evidence
- Organize the Evidence
- Review the Decision-making Process
